ENVIRONMENT AND SUSTAINABILITY POLICY

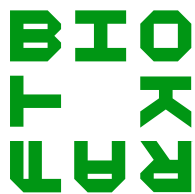

Biokraft creates sustainable solutions within renewable fuels and fertilizers for agriculture. Our work encompasses the whole chain from design and construction to production and maintenance. The policy refers to all operations within Sweden, Norway, and Korea.

The three aspects of sustainability; the financial, the environmental, and the social, form the foundation on which we make decisions. We promote a fossil free, sustainable, and circular society.

In the daily operation we maximise the environmental benefits and minimize our negative environmental impact. We work purposefully to ensure that people are not impacted in a negative way by our production or our products.

We fulfil the policy by:

- Designing, building, and operating our facilities with financial and environmental long-term
- Keeping a dialogue with, and take our social responsibility in, the local communities where we operate
- Striving towards that suppliers and partners have good working conditions, as well as reducing the risk for corruption, forced labor, child labor, and discrimination in the value chain
- Every year increasing the deliveries of sustainable biogas to the society through responsible investments
- Choosing products, transportation, and, working methods with low environmental impact
- Having measurable and specific sustainability targets that are regularly followed up on
- Fulfilling existing laws, regulations, and permits for our products through self-control
- When needed assigning focused working groups to reduce our environmental impact
- Viewing continuous improvements as a prerequisite for our business development
- Keeping an active dialogue with our stakeholders throughout the whole value chain
- Striving towards only using waste and residues from ethical sources in our biogas production
- We are applying the precautionary principle. This means that the business is conducted in a responsible way with regards to environmental risks and environmental impact by applying precautionary measures that prevent environmental damages from occurring
